

Yes — LinkedIn is highly suitable for finding both bilateral partners (especially under the strict BPSL v2 model) and outsourcing / project opportunities for Chain IIoT. The solution's positioning and the license shape the strategy quite specifically.

Quick recap of what the documents imply for partnering

Chain IIoT strengths to lead with:

- Lightweight, all-in-one edge controller that can run on **commodity hardware**.
- Hybrid native Modbus RTU + transparent LoRa.
- Fully web-native (browser-based engineering, visualization, edge runtime + on-device ML).
- Local autonomy first + cloud business processing that actively drives the edge (setpoints, policies, multi-site optimization).
- Cloud-managed facility definition packages ("pick & switch").
- Dramatically lower CapEx/integration cost and skill barrier vs classical PLC + industrial HMI + gateway stacks.
- Best fit: mid-market, multi-site, cost-sensitive, retrofit, and domains where classical stacks are economically excessive (CEA/greenhouses/vertical farms, smart care / elderly / senior living, small-to-medium commercial buildings, smart communities, aquaculture, cold chain/food storage, and several secondary segments).

BPSL v2 implications:

- Strictly **bilateral exclusive** proprietary license (not open-source, not multi-party, not transferable/sublicensable).
- Source access only for cooperative development, internal testing, and authorized joint commercial deployment between the two named parties.
- Strong isolation: no sharing with any third party (including other partners of the Licensor), confidentiality obligations survive termination, contributions to core go back to the Licensor.
- Designed for deep, exclusive partnerships rather than broad reseller ecosystems or casual integrators.

This means LinkedIn outreach should target partners who can commit to an exclusive bilateral relationship and who will value source-level customization and joint go-to-market, not just simple resale or one-off project work.

LinkedIn strategy tailored to Chain IIoT + BPSL

1. Profile & Company Page foundation

- **Headline examples:**

“Chain IIoT — Web-native edge automation on commodity hardware | Low-cost alternative to classical PLC stacks for CEA, smart care & mid-market buildings”
or more partner-oriented: “Seeking exclusive bilateral partners for Chain IIoT source collaboration (BPSL) | CEA • Smart Buildings • Care Facilities”.

- About section should clearly state the three key differentiators (web-native → commodity hardware, cloud facility packages, cloud business processing that drives the edge) and the target domains.
- Highlight Automation-as-a-Service / outcome-based models and the complementary nature vs classical stacks (not trying to replace high-SIL heavy process).
- Use the facility-package and hybrid connectivity story heavily — these are concrete and easy to understand.

2. Content that attracts the right people

Post consistently (aim for 3–5 quality posts per month) in these formats:

- Vertical problem → solution posts (e.g., “Why full industrial climate computers are often overkill for mid-sized greenhouses / high-tunnels — and what a commodity-edge + LoRa + cloud facility package approach changes”).
- Comparison tables or side-by-side (respectful) vs classical stacks focused on cost, deployment speed, skill barrier, and multi-site replication.
- Facility-package concept: “Pick-and-switch a complete ‘tomato high-tunnel’ or ‘leafy-greens rack’ definition instead of re-engineering every site.”
- Existing-screen story: ordinary Android/smart TVs or browsers as dashboards (especially powerful for senior living and multi-site buildings).
- Short technical notes on hybrid Modbus + LoRa or local autonomy during outages.
- Soft partner signals: “We work with a small number of exclusive bilateral partners under our BPSL framework who want source-level co-development and joint commercial deployment.”

Tag relevant people and companies in the CEA, building automation, and care-technology space when appropriate.

3. Who to target

A. Potential exclusive bilateral partners (BPSL fit)

- System integrators and solution providers focused on horticulture / CEA / greenhouse automation, mid-market building automation, senior living / care facilities technology, aquaculture, or cold-chain monitoring.

- Regional or vertical specialists who want differentiation through customized derivative code and are comfortable with strict exclusivity and isolation.
- IoT / edge platforms or smaller automation firms that already work with Modbus-heavy equipment and are looking for a modern web-native runtime rather than classical PLC toolchains.

Search titles: System Integrator, Solutions Architect, Automation Engineer, Controls Engineer, IoT Solutions, CEA Automation, Building Automation Specialist, etc., combined with company keywords (greenhouse, vertical farm, senior living, BMS, aquaculture, cold storage).

B. Outsourcing / project opportunities

- End customers or operators posting needs: “seeking greenhouse automation”, “looking for affordable climate control”, “multi-site building energy optimization”, “senior living environmental monitoring”, “cold room monitoring and control”.
- System integrators looking for a lighter platform to white-label or co-develop under exclusivity.
- Companies advertising Automation-as-a-Service or managed service models in the target verticals.

4. Practical search & outreach tactics on LinkedIn

- **Jobs + Posts search** (switch to Posts and filter by recent):
 "seeking partner" OR "looking for integrator" OR "need automation partner"
 OR "seeking control system" + vertical keywords (CEA, greenhouse, vertical farm, senior living, smart building, aquaculture, cold chain).
 Also: "outsourcing" automation or "project based" (PLC OR BMS OR climate control) .
- Boolean people search for decision-makers in target companies.
- Follow and engage with companies already active in the space (examples visible in current LinkedIn activity: Argus Control Systems, Green Automation, various regional SIs, Siemens CEA references, building automation firms). Comment thoughtfully on their posts before connecting.
- Join and participate in relevant groups: Controlled Environment Agriculture / indoor farming, Industrial IoT / IIoT, Smart Buildings, Senior Living Technology, aquaculture technology, etc.
- Connection + message sequence: personalize heavily around a specific vertical pain point or a recent post of theirs, briefly introduce the cost/architecture difference, and mention that deeper collaboration is structured under an exclusive bilateral source license (BPSL) for partners who want joint development and deployment.

5. Qualification filter for BPSL partners

When conversations advance, be transparent early about the bilateral exclusive nature, the isolation requirements, contribution rules, and the expectation of cooperative development + joint commercial work. This filters for serious, committed partners and avoids wasting time with broad multi-vendor integrators who expect open ecosystems or simple resale rights.

Suggested next practical steps

1. Optimize the company and key personal profiles with the positioning language above.
2. Create 4–6 cornerstone posts covering the main verticals and the three differentiators.
3. Run systematic Posts + people searches for the target verticals and start a weekly outreach cadence (10–20 highly personalized connections/messages).
4. Track who engages with content about commodity hardware, facility packages, or specific verticals — these are warm signals.
5. For pure project/outsourcing volume, also monitor Upwork/Freelancer/relevant job boards in parallel, but use LinkedIn for higher-quality, longer-term bilateral partners.

Would you like me to draft specific LinkedIn post templates, connection-request messages, or Boolean search strings focused on one or two priority verticals (e.g., CEA first, then smart care or buildings)? Or shall we refine the partner qualification criteria further based on the BPSL terms?
