

What is Chain IIoT?

Chain IIoT is a modern, lower-cost automation platform that gives customers reliable control and smart cloud capabilities **without** the high price and complexity of traditional industrial systems (PLC + industrial HMI + gateway).

It is designed for companies that need real automation but find classical industrial solutions too expensive or too complicated.

How it works (simple version)

On site (Edge)

- One compact controller handles local devices
- Connects to existing equipment via Modbus RTU
- Adds wireless sensors easily with LoRa
- Keeps running even if the internet goes down
- Can run on affordable, standard hardware

Wide area (Cellular IoT)

- Supports LTE-M / NB-IoT devices directly from the cloud
- These devices work as peers to the on-site controllers
- They talk to each other through simple MQTT messaging

In the cloud

- Business rules and optimization run in the cloud and actively guide the edge and cellular devices
- Pre-built facility “packages” (ready-made setups) can be selected and switched quickly
- Rapid app development tools let us (or partners) create custom applications fast
- One system can serve many different customers or business types at the same time (true multi-tenant)
- Partner-friendly licensing so integrators and solution providers can build and share on top of the platform
- Dashboards appear on ordinary TVs or any browser — no expensive industrial screens needed

Bottom line for the customer

They get professional automation, local reliability, cloud intelligence, and easy expansion — at a fraction of the cost and setup time of traditional industrial stacks.

Chain IIoT vs Traditional Industrial Systems

Traditional Industrial Stack	Chain IIoT	What this means for the customer
Expensive PLCs + HMIs + gateways	One affordable all-in-one controller	Lower hardware cost
Complex engineering & specialized skills	Web-based, easier to configure	Faster projects, lower engineering cost
Hard to copy the same setup to new sites	Ready-made facility packages (pick & switch)	Quick rollout across multiple locations
Usually closed systems	Open for partners + source-sharing options	Easier to work with integrators and add features
Cloud mostly just for monitoring	Cloud actively drives business rules	Real optimization and Automation-as-a-Service
Best for very large or critical plants	Built for mid-sized and multi-site operations	Right-sized solution, not overkill

When to recommend traditional systems

Large factories, highly regulated processes, or sites that already run deep on Siemens / Schneider / Rockwell.

When to recommend Chain IIoT

Most other cases — especially when cost, speed, multi-site management, or future service revenue matter.

Best Markets for Chain IIoT

Strongest fit (Primary)

- **Greenhouses & indoor farming (CEA)** – Climate, irrigation, sensors without the big industrial price tag
- **Senior living & care homes** – Comfort, safety monitoring, easy dashboards on existing TVs
- **Small-to-medium commercial buildings** – HVAC and energy control that doesn't need a full BMS

- **Residential communities & mixed-use sites** – Shared systems managed from one platform
- **Fish & shrimp farms (Aquaculture)** – Water quality and equipment control at sensible cost
- **Cold storage & food warehouses** – Temperature monitoring and multi-site compliance

Also good (Secondary)

- Outdoor agriculture & irrigation
 - Smaller water systems
 - Solar + storage or EV charging sites
 - Hotel & retail chains
 - Light manufacturing
 - Schools and campuses
 - City / municipal edge projects
-

Key Selling Points (easy to remember)

1. **Lower cost** – Commodity hardware + simpler architecture
 2. **Faster to deploy** – Ready-made packages + web tools
 3. **Works offline** – Local control stays reliable
 4. **Grows with the customer** – Easy to add sites, sensors, or cellular devices
 5. **Business-smart** – Cloud doesn't just watch; it helps run the business
 6. **Partner-ready** – Multi-tenant + source-sharing licensing makes it attractive for integrators
-

One-sentence pitch

“Chain IIoT gives mid-sized and multi-site customers real automation and cloud intelligence at a price and complexity level that traditional industrial systems simply can't match.”
